

## BIOMOLECULES (AKA MACROMOLECULES) Name: Block:

All living things share the same chemical building blocks and depend on chemical processes for survival. Life without **carbon (C)** would be as likely as life without water.

Other than water, most molecules of a cell are **carbon-based**.

- The "**biomolecules**" are composed of a backbone or carbon atoms bonded to one another. Atoms of other elements such as **hydrogen (H), oxygen (O), nitrogen (N), phosphorus (P) and Sulfur (S)** may branch off of this carbon backbone. This basic structure is the foundation for the different groups of <u>biomolecules</u>: carbohydrates, lipids, proteins and nucleic acids.
- **Carbohydrates** are used by all living things as their main source of energy. Plants and animals also use carbohydrates for structural purposes. The monomers (building blocks) of all carbohydrates are called **monosaccharides** or simple sugars.

**Directions:** Please read the directions and answer the following questions in regard to <u>each</u> model.

| Name                           | Sugar 1   | Sugar 2 |
|--------------------------------|---|---------|
|                                | H<br>С<br>H — С — ОН<br>I<br>H — С — ОН<br>С H₂OH |         |
| Ratio of Elements              |   |         |
|                                | СНО   | СНО     |
| Simplest Whole Number<br>Ratio |   |         |

MODEL 1

- 1. Use a yellow marker to mark all of the **C** (carbon) atoms in **Sugar 1**. Count and record your answer in the blank next to the **C** (carbon) in the row labeled **ratio of elements**.
- 2. Use a green marker to mark all of the **H** (hydrogen) atoms in **Sugar 1**. Count and record your answer in the blank next to the **H** (hydrogen) in the row labeled **ratio of elements**.
- 3. Use a blue marker to mark all of the **O** (oxygen) atoms in **Sugar 1.** Count and record your answer in the blank next to the **O** (oxygen) in the row labeled **ratio of elements.**
- 4. Repeat steps 1, 2 and 3 for **Sugar 2.**

**CRITICAL THINKING QUESTIONS:** Write your answers to the following questions below.

- 1. What are the only three elements that are found in monosaccharides (simple sugars)?
- 2. What is the simplest whole number ratio for each of the above simple sugars?
- 3. What is the name of the monomer of carbohydrates?
- 4. Monosaccharides (simple sugars) are called carbohydrates. Using what you have learned about the elements in monosaccharides and ratio of the elements, explain why the term carbohydrate is an appropriate term for this group of compounds.
- 5. What is the name of the biomolecule that is formed when 3 or more monosaccharides are combined?
- 6. List 2 **food** examples of a monosaccharide:
- 7. List 2 **food** examples of a polysaccharide: \_\_\_\_\_\_
- 8. What function do carbohydrates provide cells?

## Lipids or fats are made up of a **glycerol and fatty acid tails. Glycerol**

Lipids are produced when glycerol binds to the fatty acids. A maximu of three fatty acids can bind to one glycerol molecule to form a lipid.

**Saturated** fatty acid chains have all single bonds between the carbor **unsaturated** fatty acids will have 1 or more double bonds between the carbons in the chain.

| Name                           | Fatty Acid 1                | Fatty Acid 2   |
|--------------------------------|-----------------------------|--|

- Using what you know about the property of water, which model (1 or 2) above would be more likely to be polar and attracted to water (hydrophilic)? \_\_\_\_\_\_
   Explain your answer. \_\_\_\_\_\_
- 7. Using what you know about the property of water, which model (1 or 2) would more likely be nonpolar and repel the water (hydrophobic)? \_\_\_\_\_\_ Explain your answer.

 8.
 List 2 ways lipids are used by cells: \_\_\_\_\_\_

 9.
 What are the 2 types of fats: \_\_\_\_\_\_ & \_\_\_\_\_

9. List 3 examples of food that are lipids: \_\_\_\_\_

Amino acids are the basic building blocks or subunits of proteins. There are twenty essential amino acids, and each one of them is a little different.

- Each amino acid is composed of a "**common group**" (a central carbon with a single hydrogen, an amine group –NH<sub>2</sub> and a carboxyl group –COOH) and a "**variable group**" designated as *R*.
- It is the **variable group** or **R group** that determines the differences in properties. All organisms need some proteins, whether they are used in muscles or as simple structures in the cell membrane.

| Name:                | Amino Acid 1              | Amino Acid 2  |
|----------------------|---------------------------|---|
|                      | Н<br>Н2N—С—СООН<br> <br>Н | $\begin{array}{c} CH3 \\ \downarrow \\ CH2 \\ H3C - C - H \\ H2N - C - COOH \\ \downarrow \\ H \end{array}$ |
| Ratio of<br>Elements | CHON                      | CHON  |

- 1. Use a yellow marker to mark all of the **C** (carbon) atoms in **Amino Acid 1**. Count and record your answer in the blank next to the **C** (carbon) in the row labeled **ratio of elements**.
- 2. Use a green marker to mark all of the **H** (hydrogen) atoms in **Amino Acid 1**. Count and record your answer in the blank next to the **H** (hydrogen) in the row labeled **ratio of elements**.
- 3. Use a blue marker to mark all of the **O** (oxygen) atoms in **Amino Acid 1.** Count and record your answer in the blank next to the **O** (oxygen) in the row labeled **ratio of elements.**
- 4. Repeat steps 1, 2 and 3 for Amino Acid 2.
- 5. Use a pen or a pencil and draw a **box** around the "**common group**" of, **Amino Acid 1** and **Amino Acid 2**.
- 6. Circle and label the **R group** in each molecule.

## **CRITICAL THINKING QUESTIONS:**

*Circle the R group* in each of the amino acids below and draw a box around the common group.

**EXTENSION QUESTIONS:** Study the diagrams below. Indicate whether the diagram is an example of a carbohydrate, fatty acid or an amino acid.

Nucleic acids include DNA and RNA. The **monomer** of a nucleic acid **Nucleotide** is called a **nucleotide** and is composed of a pentose (5 sided sugar), a nitrogen base and a phosphate group (-PO4). The sugar found in DNA is called **Dexoyribose**, while the sugar found in RNA is called **Ribose. DNA** stores genetic information, while **RNA** copies and transmits the genetic information.

| MODEL 4              |  |   |
|----------------------|--|---|
| Name                 | DNA  | RNA   |
|                      | $\begin{array}{c} \begin{array}{c} \begin{array}{c} \begin{array}{c} \begin{array}{c} \begin{array}{c} \end{array} \\ \end{array} \\ \end{array} \\ \end{array} \\ \end{array} \\ \end{array} \\ \begin{array}{c} \begin{array}{c} \\ \end{array} \\ \end{array} \\ \end{array} \\ \end{array} \\ \end{array} \\ \begin{array}{c} \\ \end{array} \\ \end{array} \\ \begin{array}{c} \\ \end{array} \\ \end{array} \\ \end{array} \\ \begin{array}{c} \\ \\ \end{array} \\ \end{array} \\ \begin{array}{c} \\ \\ \end{array} \\ \end{array} \\ \begin{array}{c} \\ \end{array} \\ \end{array} \\ \begin{array}{c} \\ \end{array} \\ \begin{array}{c} \\ \\ \end{array} \\ \end{array} \\ \begin{array}{c} \\ \\ \end{array} \\ \end{array} \\ \begin{array}{c} \\ \end{array} \\ \end{array} \\ \begin{array}{c} \\ \\ \end{array} \\ \begin{array}{c} \\ \end{array} \\ \end{array} \\ \begin{array}{c} \end{array} \\ \end{array} \\ \begin{array}{c} \\ \end{array} \\ \end{array} \\ \end{array} \\ \end{array} \\ \begin{array}{c} \\ \end{array} \\ $ | $\begin{array}{c} & & & \\ & &$ |
| Ratio of<br>Elements | C H O N P  | CHONP   |

- 1. Use a yellow marker to mark all of the **C** (carbon) atoms in **DNA**. Count and record your answer in the blank next to the **C** (carbon) in the row labeled **ratio of elements**.
- 2. Use a green marker to mark all of the **H** (hydrogen) atoms in **DNA**. Count and record your answer in the blank next to the **H** (hydrogen) in the row labeled **ratio of elements.**
- 3. Use a blue marker to mark all of the **O** (oxygen) atoms in **DNA.** Count and record your answer in the blank next to the **O** (oxygen) in the row labeled **ratio of elements.**
- 4. Repeat steps 1, 2 and 3 for RNA.

## **CRITICAL THINKING QUESTIONS:**

| 1. | Are there any <b>elements</b> in the nucleic acid structures that are <b>not</b> in the other three models? |
|----|---|
|    | If yes, what is/are they?   |
| 2. | List the 3 parts that make a nucleotide:  |
| 3. | What is the function of DNA?  |
| 4. | What is the function of RNA?  |
| 5. | What is the name of the 5 sided sugar found in DNA?   |
| 6. | What is the name of the 5 sided sugar found in RNA?   |

| All living things contain the element                                 | Carbo  | on is unique because:          |
|---|--|--------------------------------|
| 1   |  |                                |
| 2   |  |                                |
| 3   |  |                                |
|   |  |                                |
| are " <b>gian</b>   | t molecules" formed by many smaller          | r                              |
| Small molecules that join to make larger mole                         | ecules are called                            | ·                              |
| Monomers join together to form  |  |                                |
| This process is called  |  |                                |
| There are 4 major macromolecule groups fou                            | und in all living things:                    |                                |
| 1   |  |                                |

| 3. monosaccharide |  |                                       |
|                   |  |                                       |
|                   |  |                                       |
|                   |  |                                       |
|                   |  |                                       |
| 4. peptide        |  |                                       |
|                   |  |                                       |
|                   |  |                                       |
|                   |  |                                       |
|                   |  |                                       |
| 5. triglyceride   |  |                                       |
|                   |  |                                       |
|                   |  |                                       |
|                   |  |                                       |
|                   |  |                                       |
| 6. nucleotide     |  |                                       |
|                   |  |                                       |
|                   |  |                                       |
|                   |  |                                       |
|                   |  |                                       |
| 7. enzyme         |  |                                       |
|                   |  |                                       |
|                   |  |                                       |
|                   |  |                                       |
|                   |  |                                       |
| 8. catalyst       |  |                                       |
|                   |  |                                       |
|                   |  |                                       |
|                   |  |                                       |
|                   |  |                                       |
| 1                 |  |                                       |
